I. Introduction

1.1 Background

Since the 2020s, driven by the "America First" trade ideology, U.S. tariff policy has entered a phase of in-depth adjustment. On April 2, 2025, the Trump administration introduced the so-called "Reciprocal Tariffs" policy, establishing a 10% "minimum baseline tariff" on all trading partners and imposing additional higher tariffs on approximately 60 countries and regions with which the U.S. ran trade deficits, including China. The U.S. claimed that varying tariff rates and non-tariff barriers among trading partners made it harder for American manufacturers to sell products abroad, leading to persistent U.S. trade deficits and manufacturing decline. Thus, it imposed "reciprocal tariffs" on all countries to reduce its trade deficit and promote manufacturing reshoring. However, this policy is inconsistent with the fundamental principle of "Most-Favored-Nation (MFN) Treatment" of the World Trade Organization (WTO) and also challenges the WTO's tariff preference principle for developing countries. Under WTO rules, members must apply uniform tariffs to all partners, but the Trump administration exercised unilateral pressure and bilateral negotiations to implement widely varying tariff standards across economies, with agreed rates far exceeding previous levels. According to a tariff tracking tool jointly developed by the WTO and International Monetary Fund (IMF), the U.S. trade-weighted average tariff rate on all products rose sharply from 2.44% at the start of 2025 to 20.11% by August 2025. A Yale Budget Lab report noted that this tariff increase pushed the U.S. overall average effective tariff rate to its highest level since 1933.

Beyond serving as a source of fiscal revenue, tariffs are an important tool of national trade policy. Appropriate tariffs can protect domestic industries from global economic monopoly and coercive practices, and are therefore permitted by the WTO. However, the impact of tariffs is multifaceted: excessively high tariffs hinder the development of global trade and are detrimental to long-term world economic growth. In the short term, high U.S. tariffs may bring benefits such as increased tariff revenue and a reduced trade deficit, but they also lead to declining exports and higher domestic consumer prices.

For example, according to statistics from the General Administration of Customs of the People's Republic of China (GACC), in the month the "reciprocal tariffs" took effect, U.S. imports from China fell 20% year-on-year, while U.S. exports to China dropped 13% due to Chinese countermeasures. By May 2025, imports from China had fallen 35% compared with May 2024, and exports to China declined 18%. In absolute terms, the U.S. trade deficit with China narrowed from \$30.8 billion in May 2024 to \$18.0 billion in May 2025, but U.S. exports to China also fell from \$13.2 billion to \$10.4 billion, negatively impacting related U.S. industries. Overall, the adverse effects of high tariffs on U.S. trade and the economy cannot be overlooked.

The introduction of this policy marks a further escalation of U.S. unilateral trade protectionism, exerting a direct impact on the global economic and trade landscape. The implementation of the U.S. "Reciprocal Tariffs" policy has disrupted traditional tariff rules and the global trade order. Globally, developed economies such as Europe and the United States have long dominated the formulation of global tariff rules and the maintenance of trade order, but their trade policies have gradually tilted toward protectionism in recent years, with the U.S. "Reciprocal Tariffs" policy being a typical example. While in the short term, some countries with trade surpluses with the U.S. (such as China) have been significantly impacted by the tariffs, in the long run, the policy will further hinder global trade development, undermine world economic growth, trigger countermeasures from many countries, and exacerbate global trade frictions.

This study aims to combine global trade dynamics and the actual impact of the U.S. "Reciprocal Tariffs" policy to assess its effects on the international economic and trade landscape, industrial development of various countries, and consumer welfare since its implementation. It strives to establish a scientific evaluation framework for the impact of tariff policies, predict the evolutionary trend of global trade rules in the future, and provide strategic recommendations for countries to respond to unilateral tariff policies, safeguard the multilateral trading system, and achieve the sustainable development of the global economy and trade.

1.2 Question Restatement

By utilizing the attached U.S. foreign trade data (2020 onwards) and supplementary information collected from authoritative channels such as WTO reports and national customs statistics, we will conduct an in-depth analysis of how U.S. tariff adjustments reshape cross-border trade patterns and affect the economic operations of key regions. Combined with the current global trade order and the policy responses of major economies, we will put forward practical countermeasures and development suggestions for industries, such as soybean, automobile, and semiconductor, impacted by tariff changes.

1.2.1 *Question 1*

The U.S., Brazil and Argentina are top soybean exporters, and China the largest importer. Analyze their current soybean trade, build a model to assess U.S. tariff impacts on their soybean industries, and estimate post-adjustment export volume and value distribution.

1.2.2 *Question 2*

The U.S. is the second-largest auto market and top importer; 46% of its 2024 car sales were imports, mainly from Japan. Japan also produces in the U.S. or Mexico for U.S. export. Analyze Japan's U.S. auto position, build a model with Japan's non-tariff responses to study U.S. tariff impacts on their auto trade, U.S. import structure and U.S. auto industry.

1.2.3 *Question 3*

The U.S. leads the global semiconductor industry but lacks strong manufacturing. Biden's 2022 CHIPS Act uses subsidies; Trump's 2025 admin claims tariffs work better. The U.S. also controls high-end chip exports to China. Build a model to analyze U.S. tariff effects on domestic semiconductor manufacturing and high/mid/low-end chip trade, considering efficiency and national security.

1.2.4 Question 4

Higher tariffs may raise U.S. short-term tariff revenue but cut trade volumes, lowering revenue long-term. Build a model to analyze short/medium-term tariff impacts on U.S. revenue and predict net changes in Trump's second term.

1.2.5 Question 5

U.S. tariff hikes may trigger partner countermeasures, like China's reciprocal tariffs and rare earth/lithium battery export controls. These affect U.S. trade, agriculture, industry and financial markets. Select/construct indicators to model tariff impacts on the U.S. economy and evaluate if "reciprocal tariffs" drive manufacturing reshoring.

II. Problem Analysis

2.1 Analysis of Question 1

2.2 Analysis of Question 2

2.3 Analysis of Question 3

2.4 Analysis of Question 4

2.5 Analysis of Question 5

III. Model Assumptions

1. All countries involved are rational economic entities that pursue the maximization of their own national (or regional) economic welfare or strategic objectives.
2. In the absence of new major exogenous shocks (e.g., large-scale wars, global pandemics, or natural disasters), the basic patterns of global supply, demand, and trade flows remain continuous and predictable in the short to medium term (2025–2029).

3. Tariff changes implemented by the United States under the “Reciprocal Tariffs” policy announced on April 2, 2025, are fully enforced and remain stable within the modeling horizon unless otherwise specified.
4. Trading partners’ responses (including counter-tariffs, non-tariff barriers, export controls, or production relocation) occur with reasonable lags and can be approximated by observable policy signals or historical retaliation patterns.
5. Exchange rates fluctuate within a reasonable range; unless explicitly modeled, we assume purchasing power parity holds approximately or use fixed exchange rates for simplicity in specific sub-models.
6. Commodity and product categories under analysis (soybeans, automobiles, semiconductors, etc.) are sufficiently homogeneous within their respective HS codes so that price elasticity and substitution effects can be estimated at the aggregate level.
7. Domestic prices in importing countries fully or partially pass through changes in tariff-inclusive import prices according to estimated pass-through elasticities.
8. Supply capacities of exporting countries have short-term rigidities but can adjust gradually through acreage changes, capacity utilization, or investment in the medium term.
9. Government tariff revenue is calculated as the product of the effective tariff rate and the dutiable import value; smuggling and trade mis-invoicing are negligible.
10. National security considerations and export control measures (especially on high-end semiconductors and critical minerals) are treated as exogenous policy constraints rather than purely economic variables when necessary.
11. All statistical data obtained from official sources are accurate and reliable; minor data gaps are filled by credible interpolation or simulation methods.
12. Ceteris paribus holds for variables not explicitly included in each sub-model.

IV. Description of the Symbols

Table 1 Main Symbols and Descriptions

Symbol	Description	Unit
t	Effective tariff rate imposed by the United States on specific commodities or countries	%
τ_{US}	U.S. “Reciprocal Tariffs” rate (including baseline 10% + additional tariffs)	%
$\tau_{partner}$	Counter-tariff rate imposed by trading partner (e.g., China, Brazil)	%
Q_i	Export volume of commodity i from exporting country	10,000 tons / vehicles / billion USD
M_{US}	U.S. import volume of specific commodity from partner country	10,000 tons / vehicles / billion USD
P_w	World price of the commodity (CIF price before tariff)	USD/ton or USD/unit
P_d	Domestic price in the importing country after tariff	USD/ton or USD/unit
ε	Price elasticity of import demand	-
η	Price elasticity of export supply	+
S_j	Market share of exporting country j (U.S., Brazil, Argentina, Japan, etc.)	%
R_{tariff}	U.S. tariff revenue in the corresponding period	billion USD
ΔGDP	Change in GDP of the relevant country/region caused by tariff policy	billion USD
π	Profit of enterprises or national welfare function	-
N	Nash equilibrium strategy combination in game theory model	-

All monetary values are in current U.S. dollars unless otherwise specified. Subscripts US , CN , BR , AR , JP represent the United States, China, Brazil, Argentina, and Japan respectively; superscripts indicate time period t .

V. Problem 1: Establishment and Solution of the Model

5.1 Data Analysis

5.2 Model Construction

5.3 Model Solving

5.4 Result Analysis

VI. Problem 2: Establishment and Solution of the Model

6.1 Data Analysis

6.2 Model Construction

6.3 Model Solving

6.4 Result Analysis

VII. Problem 3: Establishment and Solution of the Model

7.1 Data Analysis

7.2 Model Construction

7.3 Model Solving

7.4 Result Analysis

VIII. Problem 4: Establishment and Solution of the Model

8.1 Data Analysis

8.2 Model Construction

8.3 Model Solving

8.4 Result Analysis

IX. Problem 5: Establishment and Solution of the Model

9.1 Data Analysis

9.2 Model Construction

9.3 Model Solving

9.4 Result Analysis

X. Model Evaluation

10.1 Advantages of the Model

1. Advantage 1
2. Advantage 2
3. Advantage 3

10.2 Disadvantages of the Model

1. Disadvantage 1
2. Disadvantage 2
3. Disadvantage 3
